

GIT & GITHUB

VERSION CONTROL

What is Version Control?

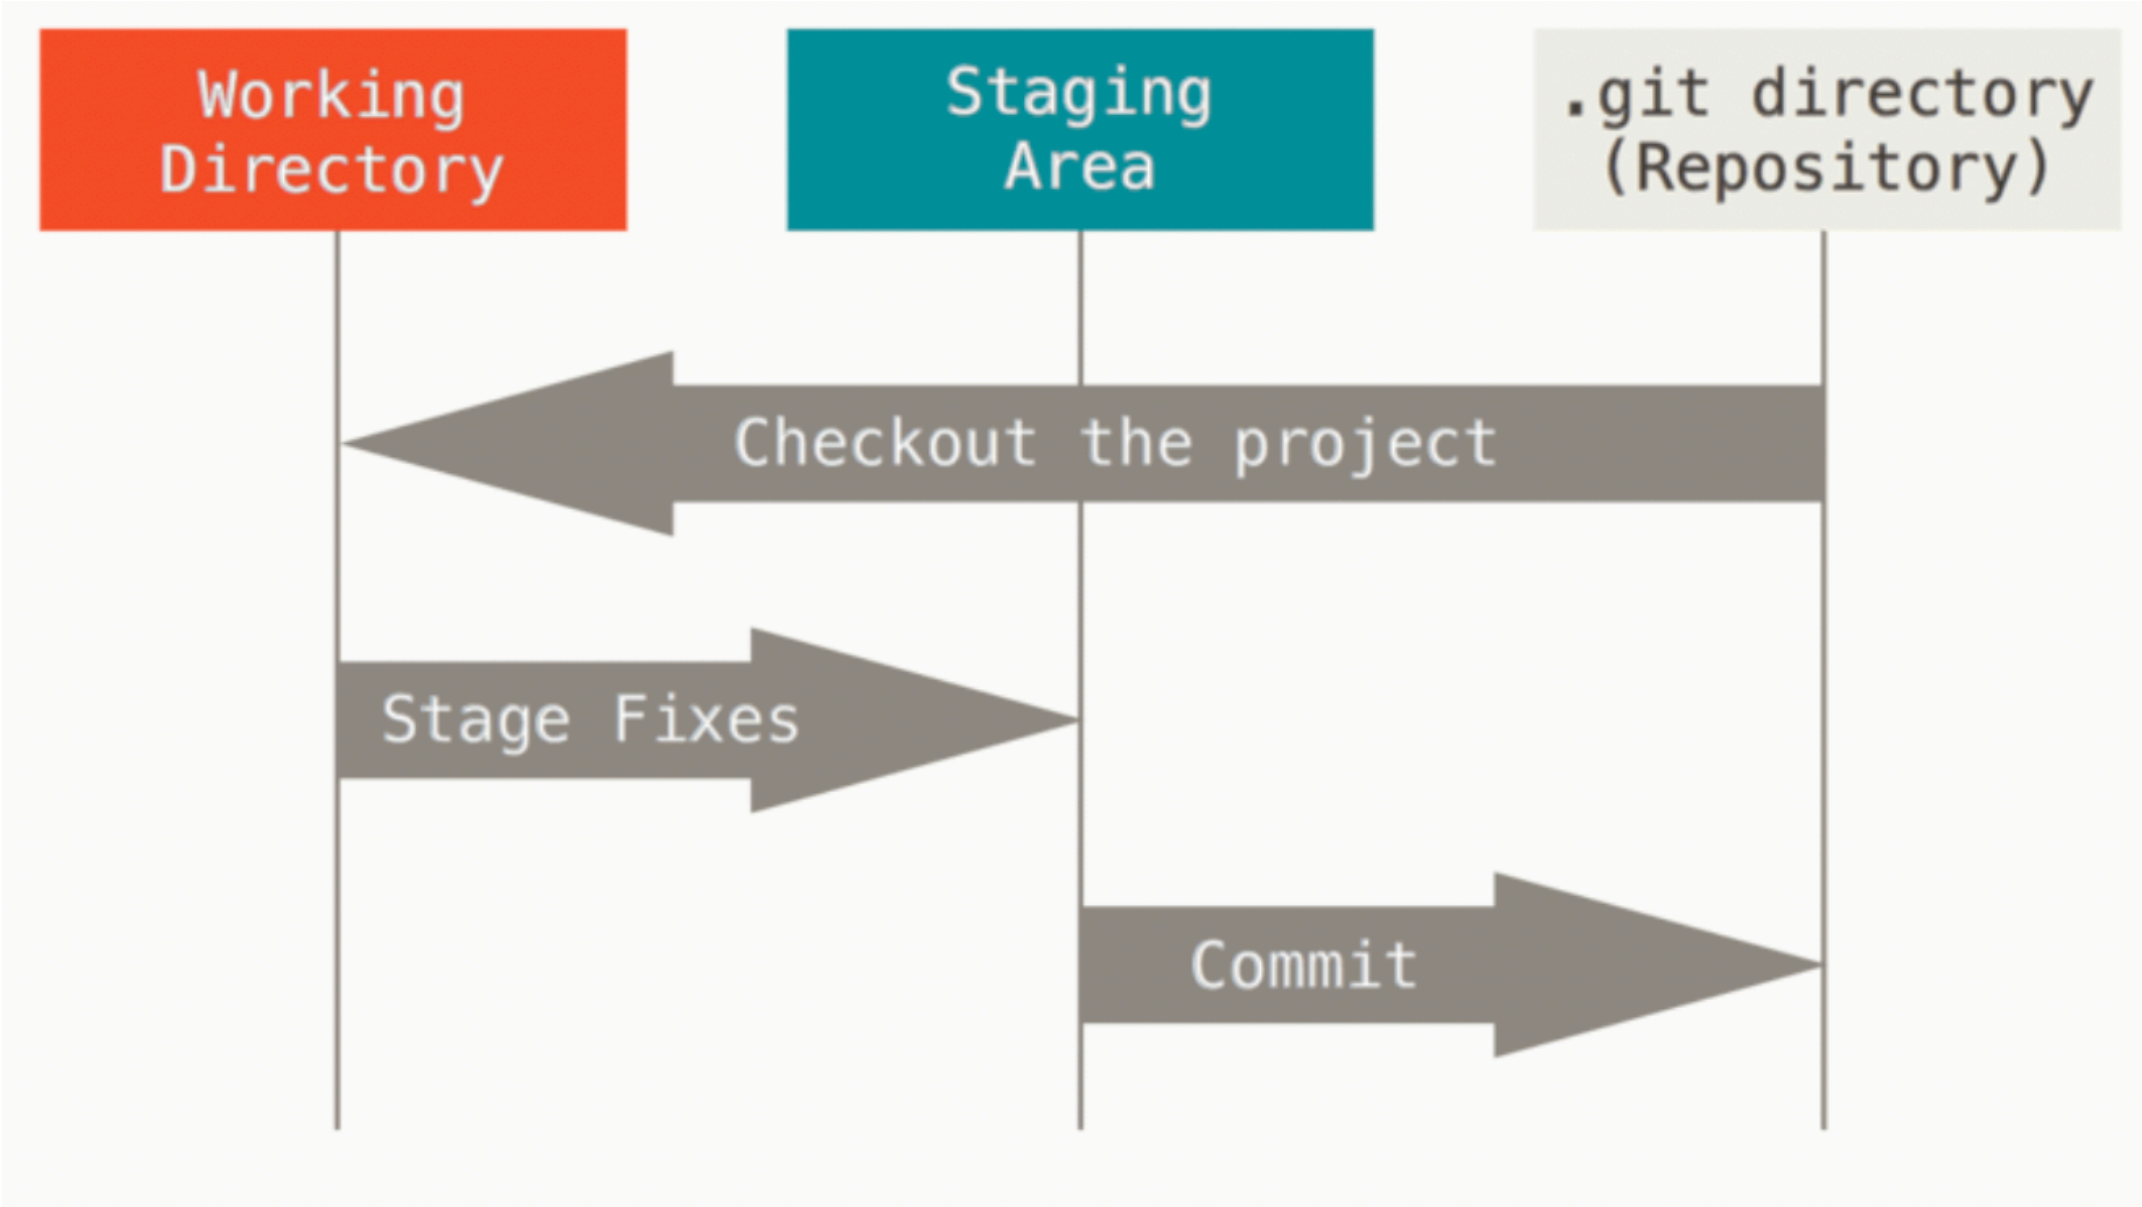

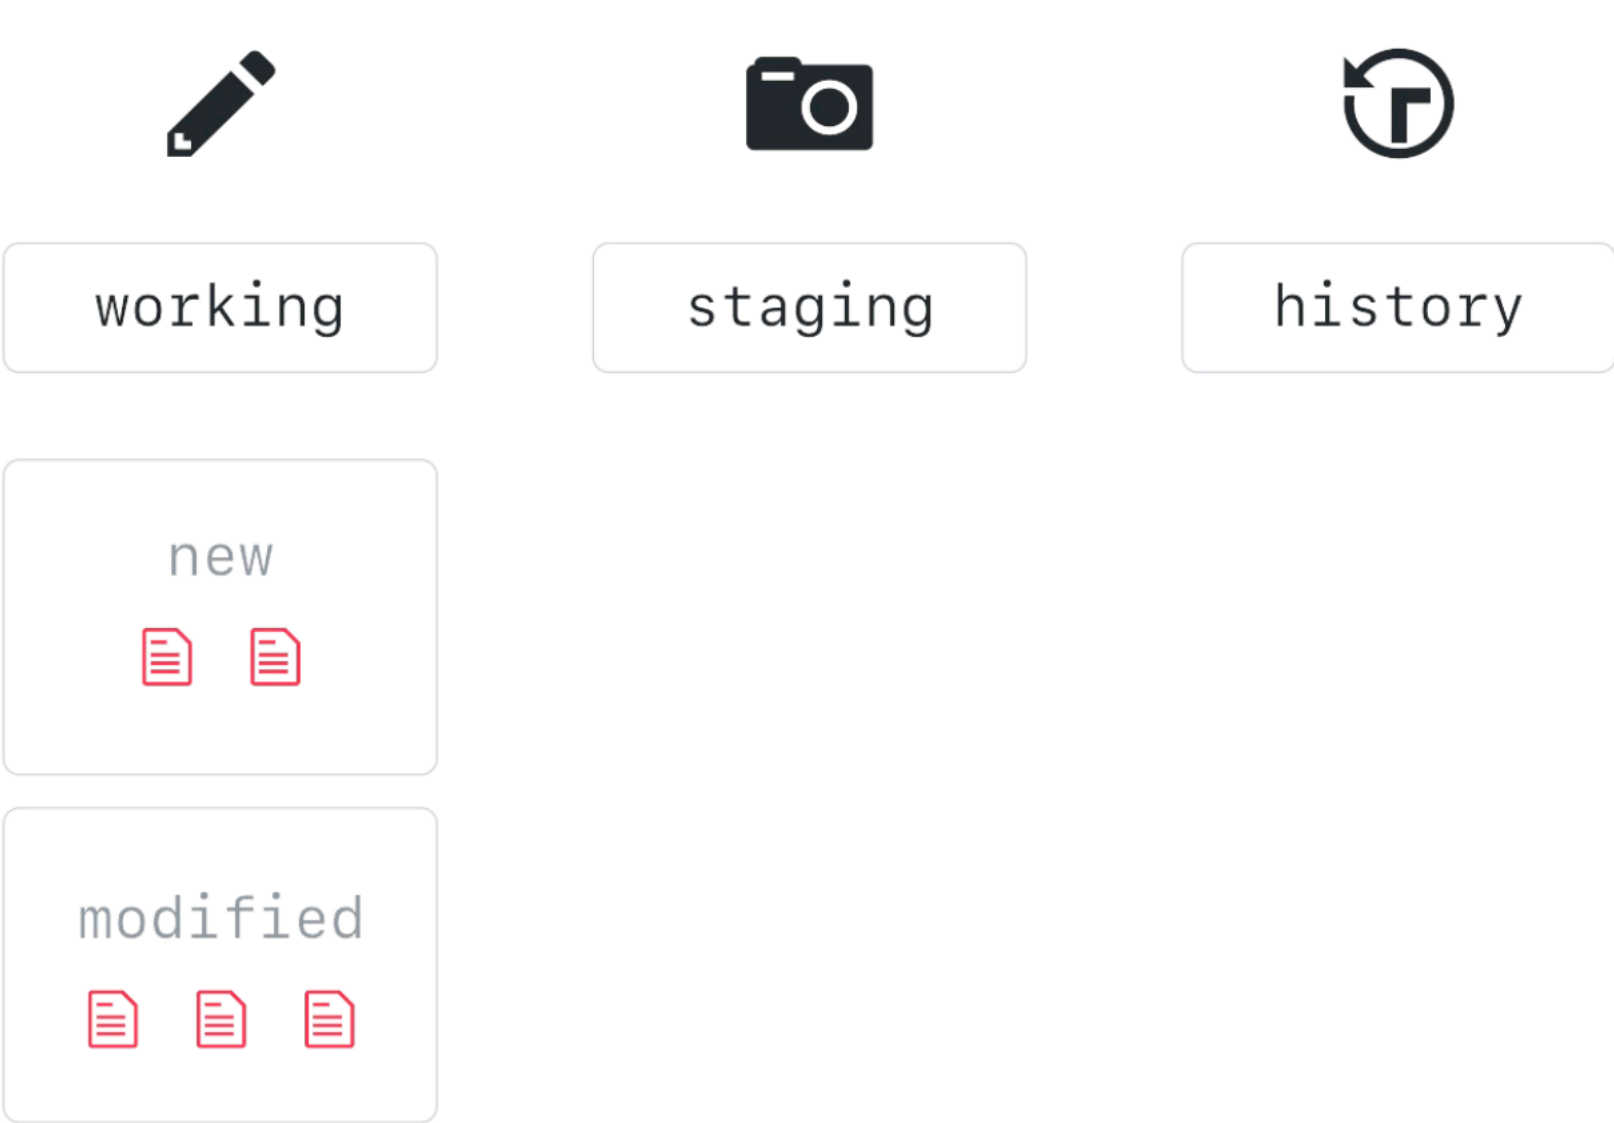

GIT & GITHUB

Git is a free and open source distributed version control system designed to handle everything from small to very large projects with speed and efficiency.

GitHub is a collaboration platform built on top of a distributed version control system called Git.

A Git repository is a virtual storage of your project. It allows you to save versions of your code, which you can access when needed.

GIT WORKING MECHANISM

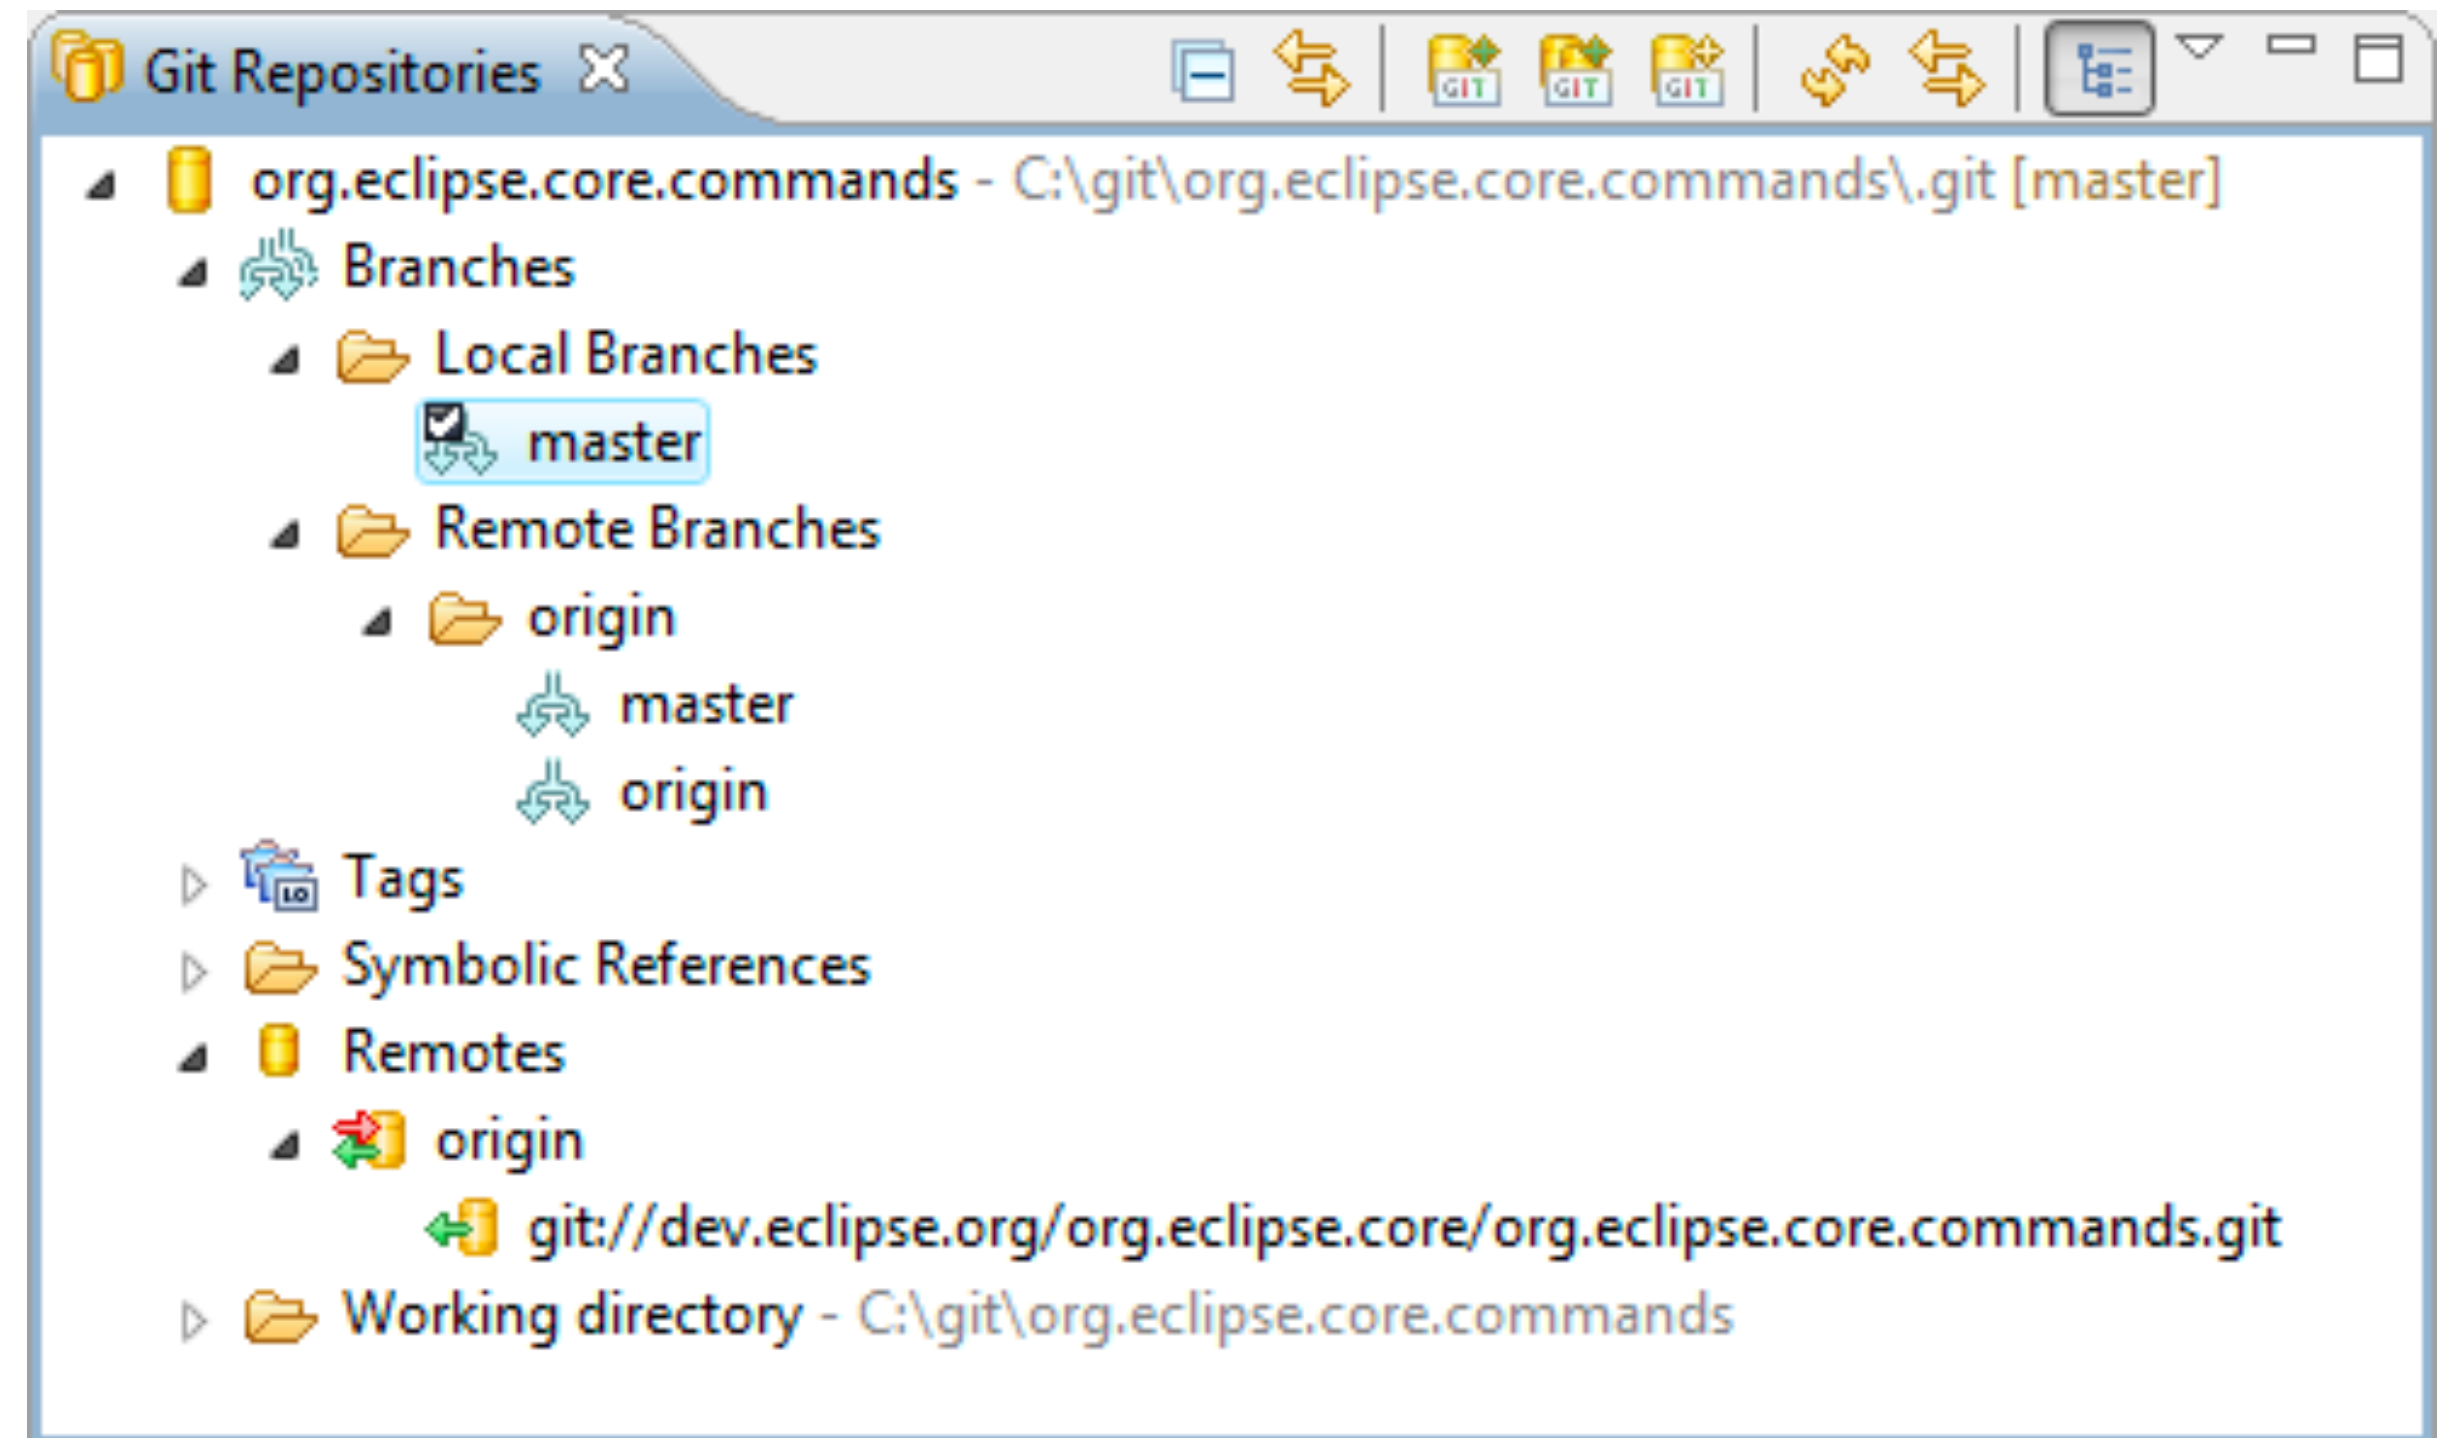

EGIT-ECLIPSE

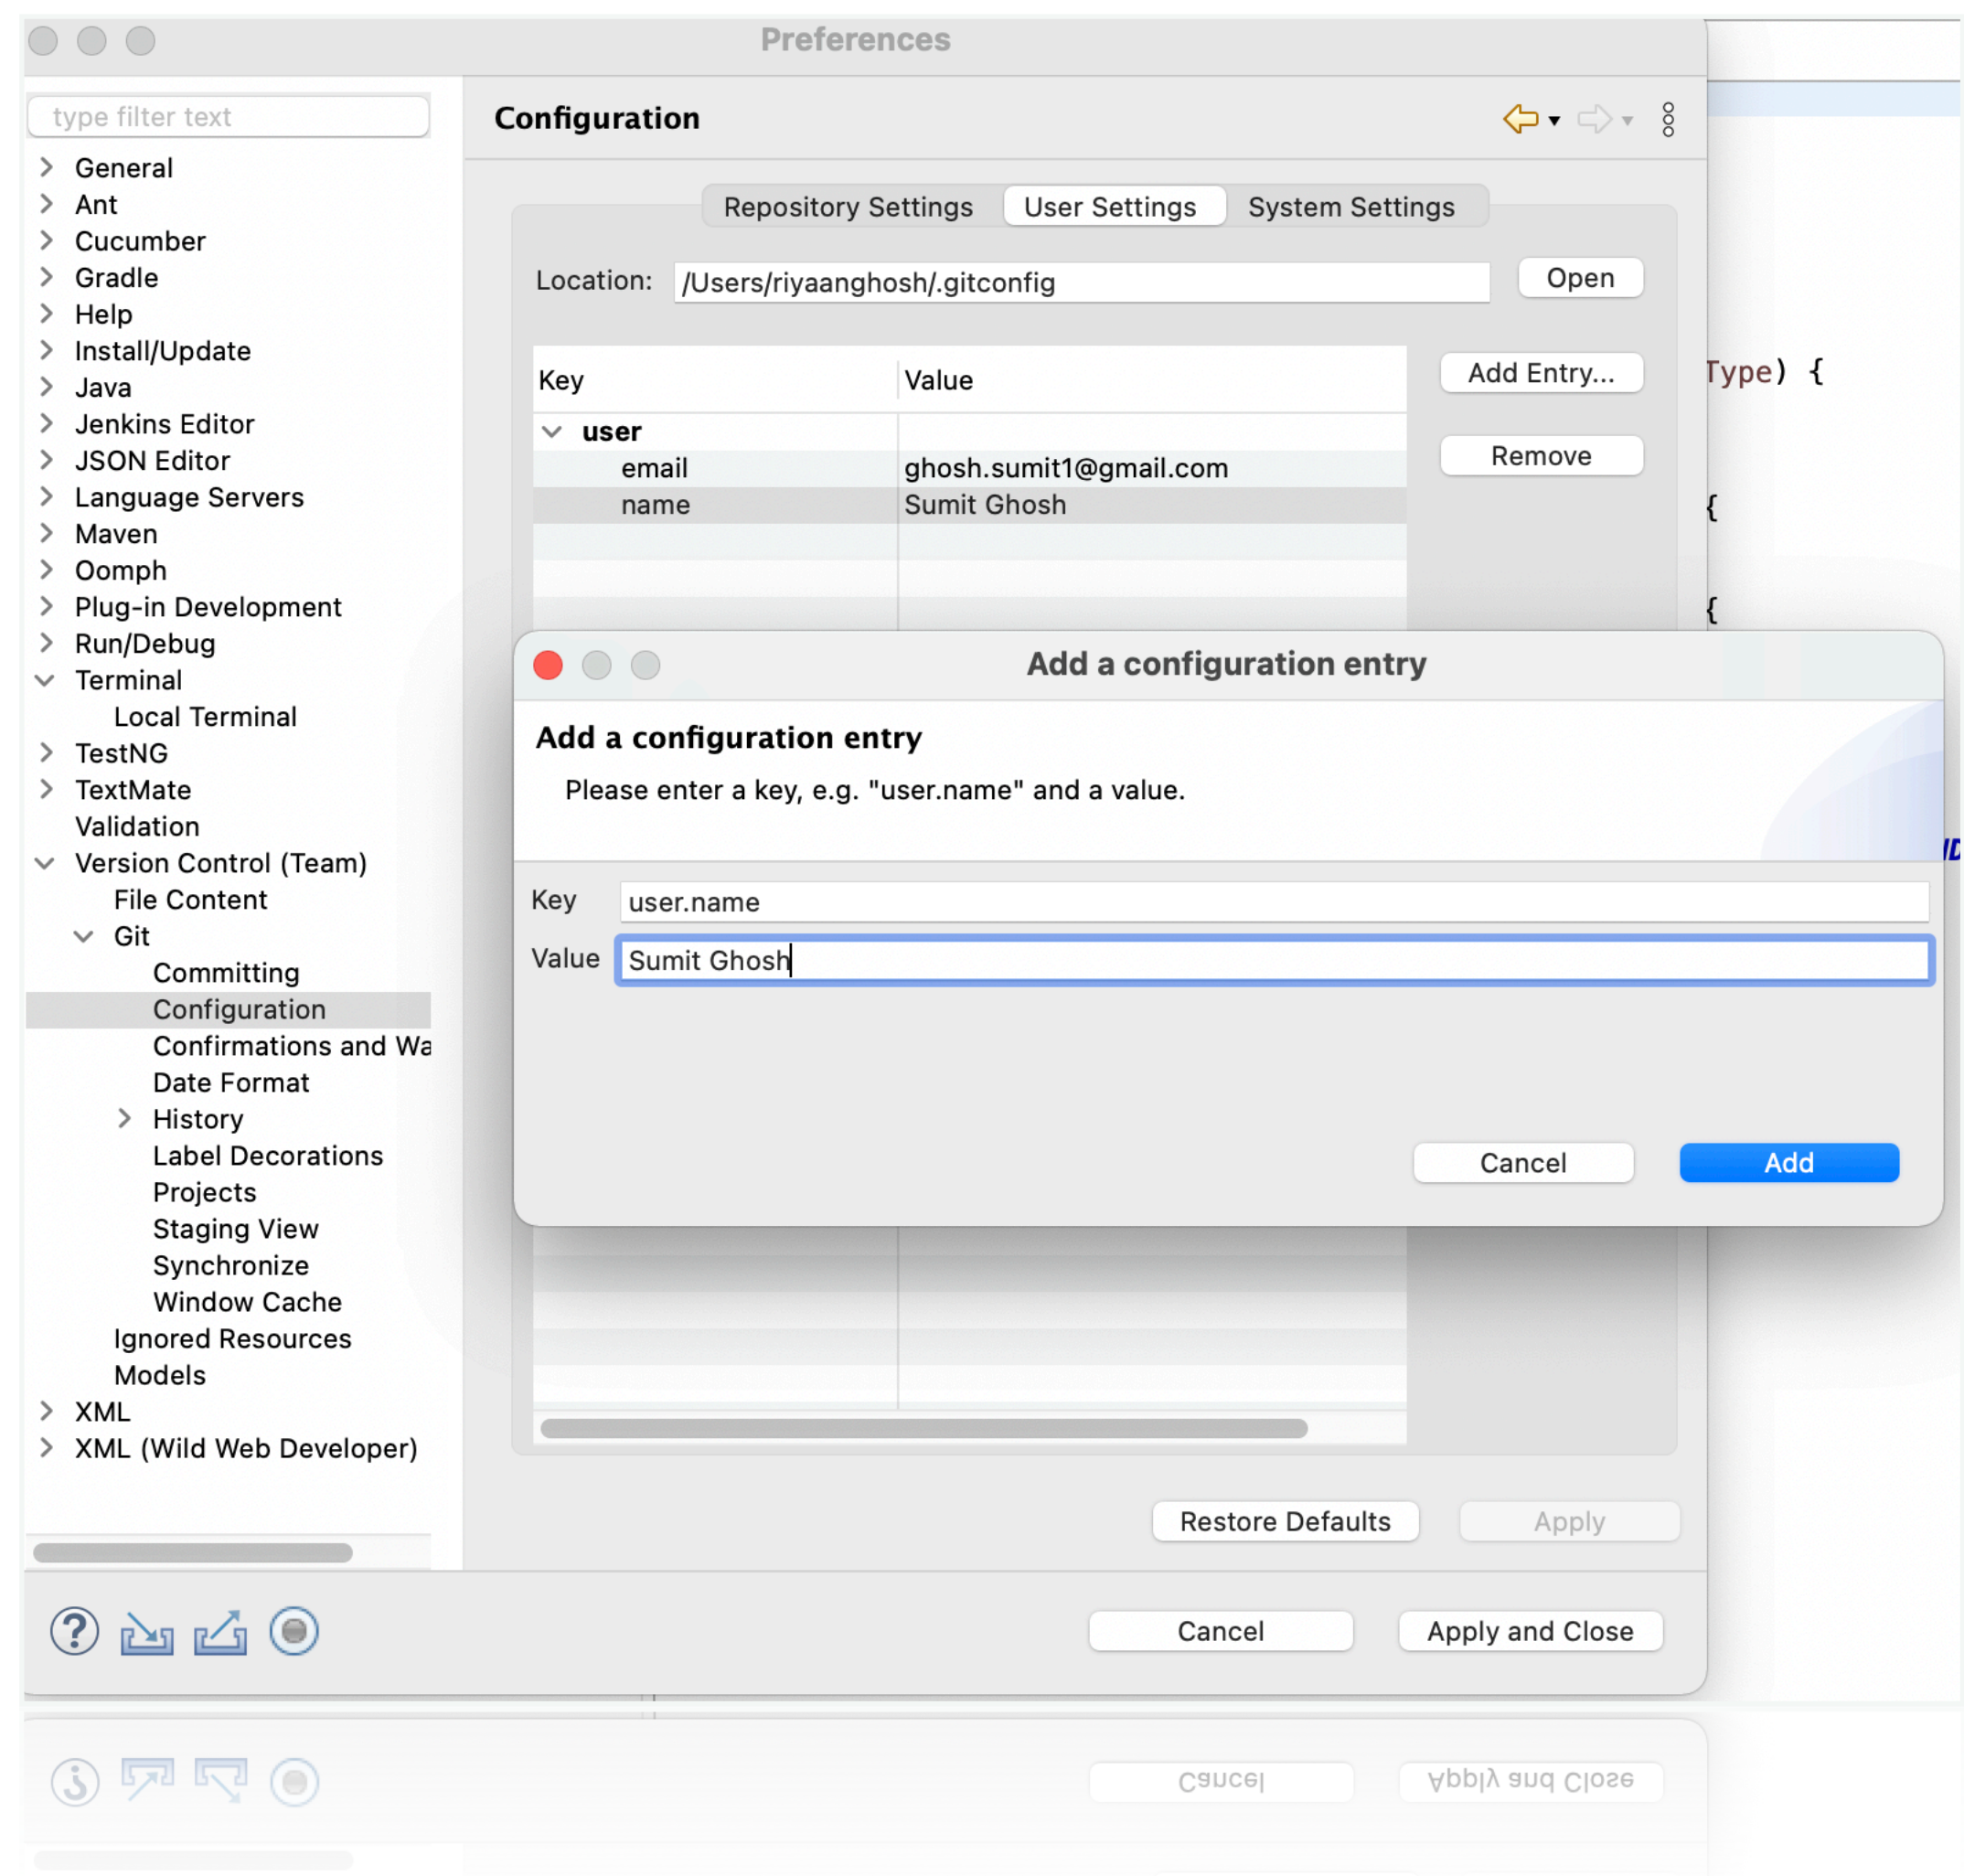

EGIT

EGit is an Eclipse Team provider for the Git version control system.

Git is a distributed SCM, which means every developer has a full copy of all history of every revision of the code, making queries against the history very fast and versatile.

CONFIGURATION

Window > Preferences > Team > Git > Configuration

CREATE REPOSITORY

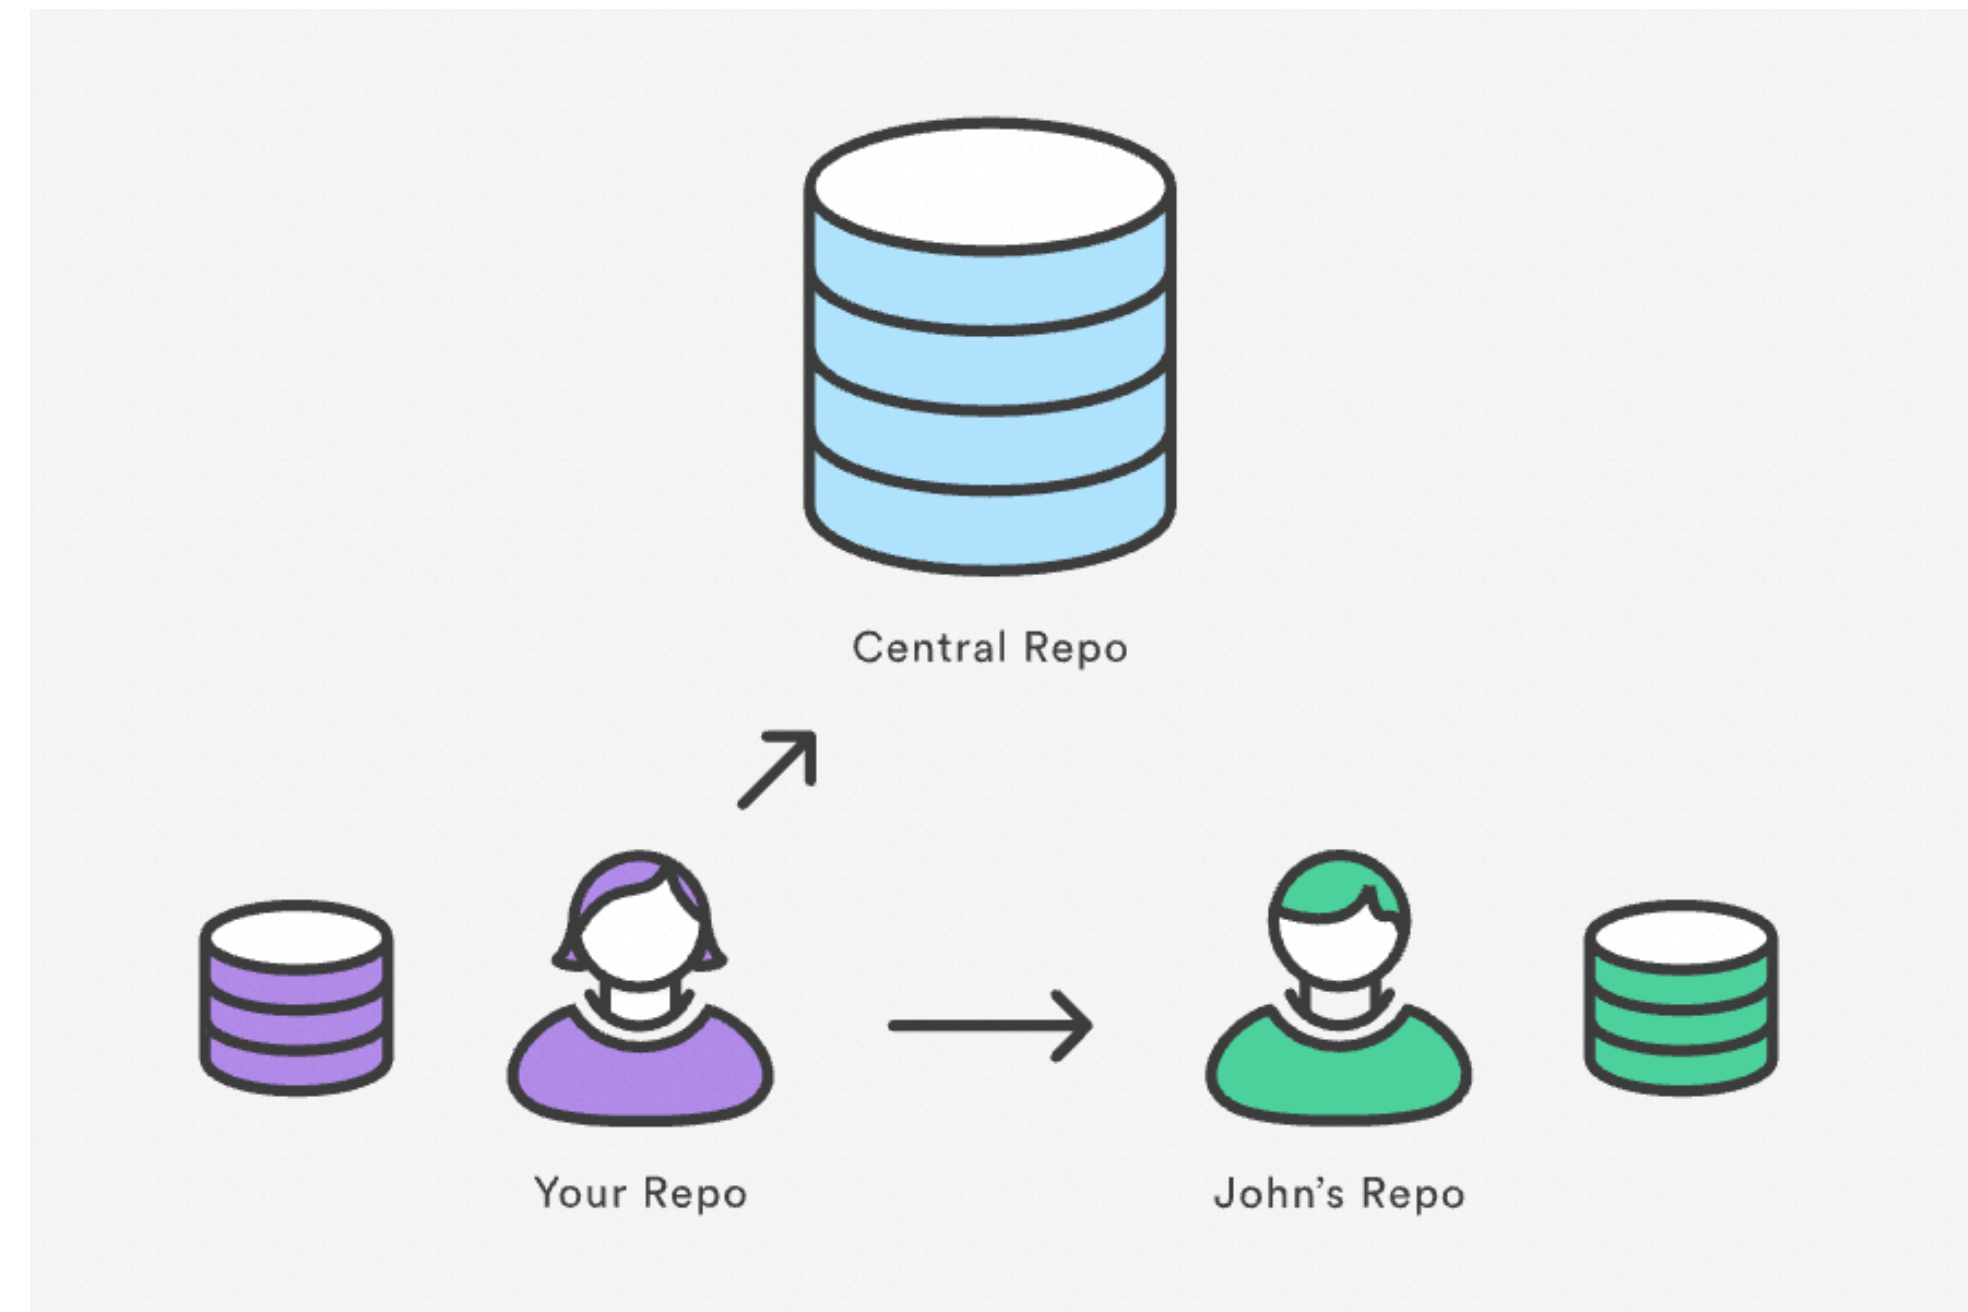

- ▶ Create Repository
- ▶ Commit
- ▶ Inspect History
- ▶ Commit Reverse
- ▶ Stashes
- ▶ Git Ignore
- ▶ Add Index

BRANCHES

- ▶ Create Branch
- ▶ Checkout Branches
- ▶ Merge Branch

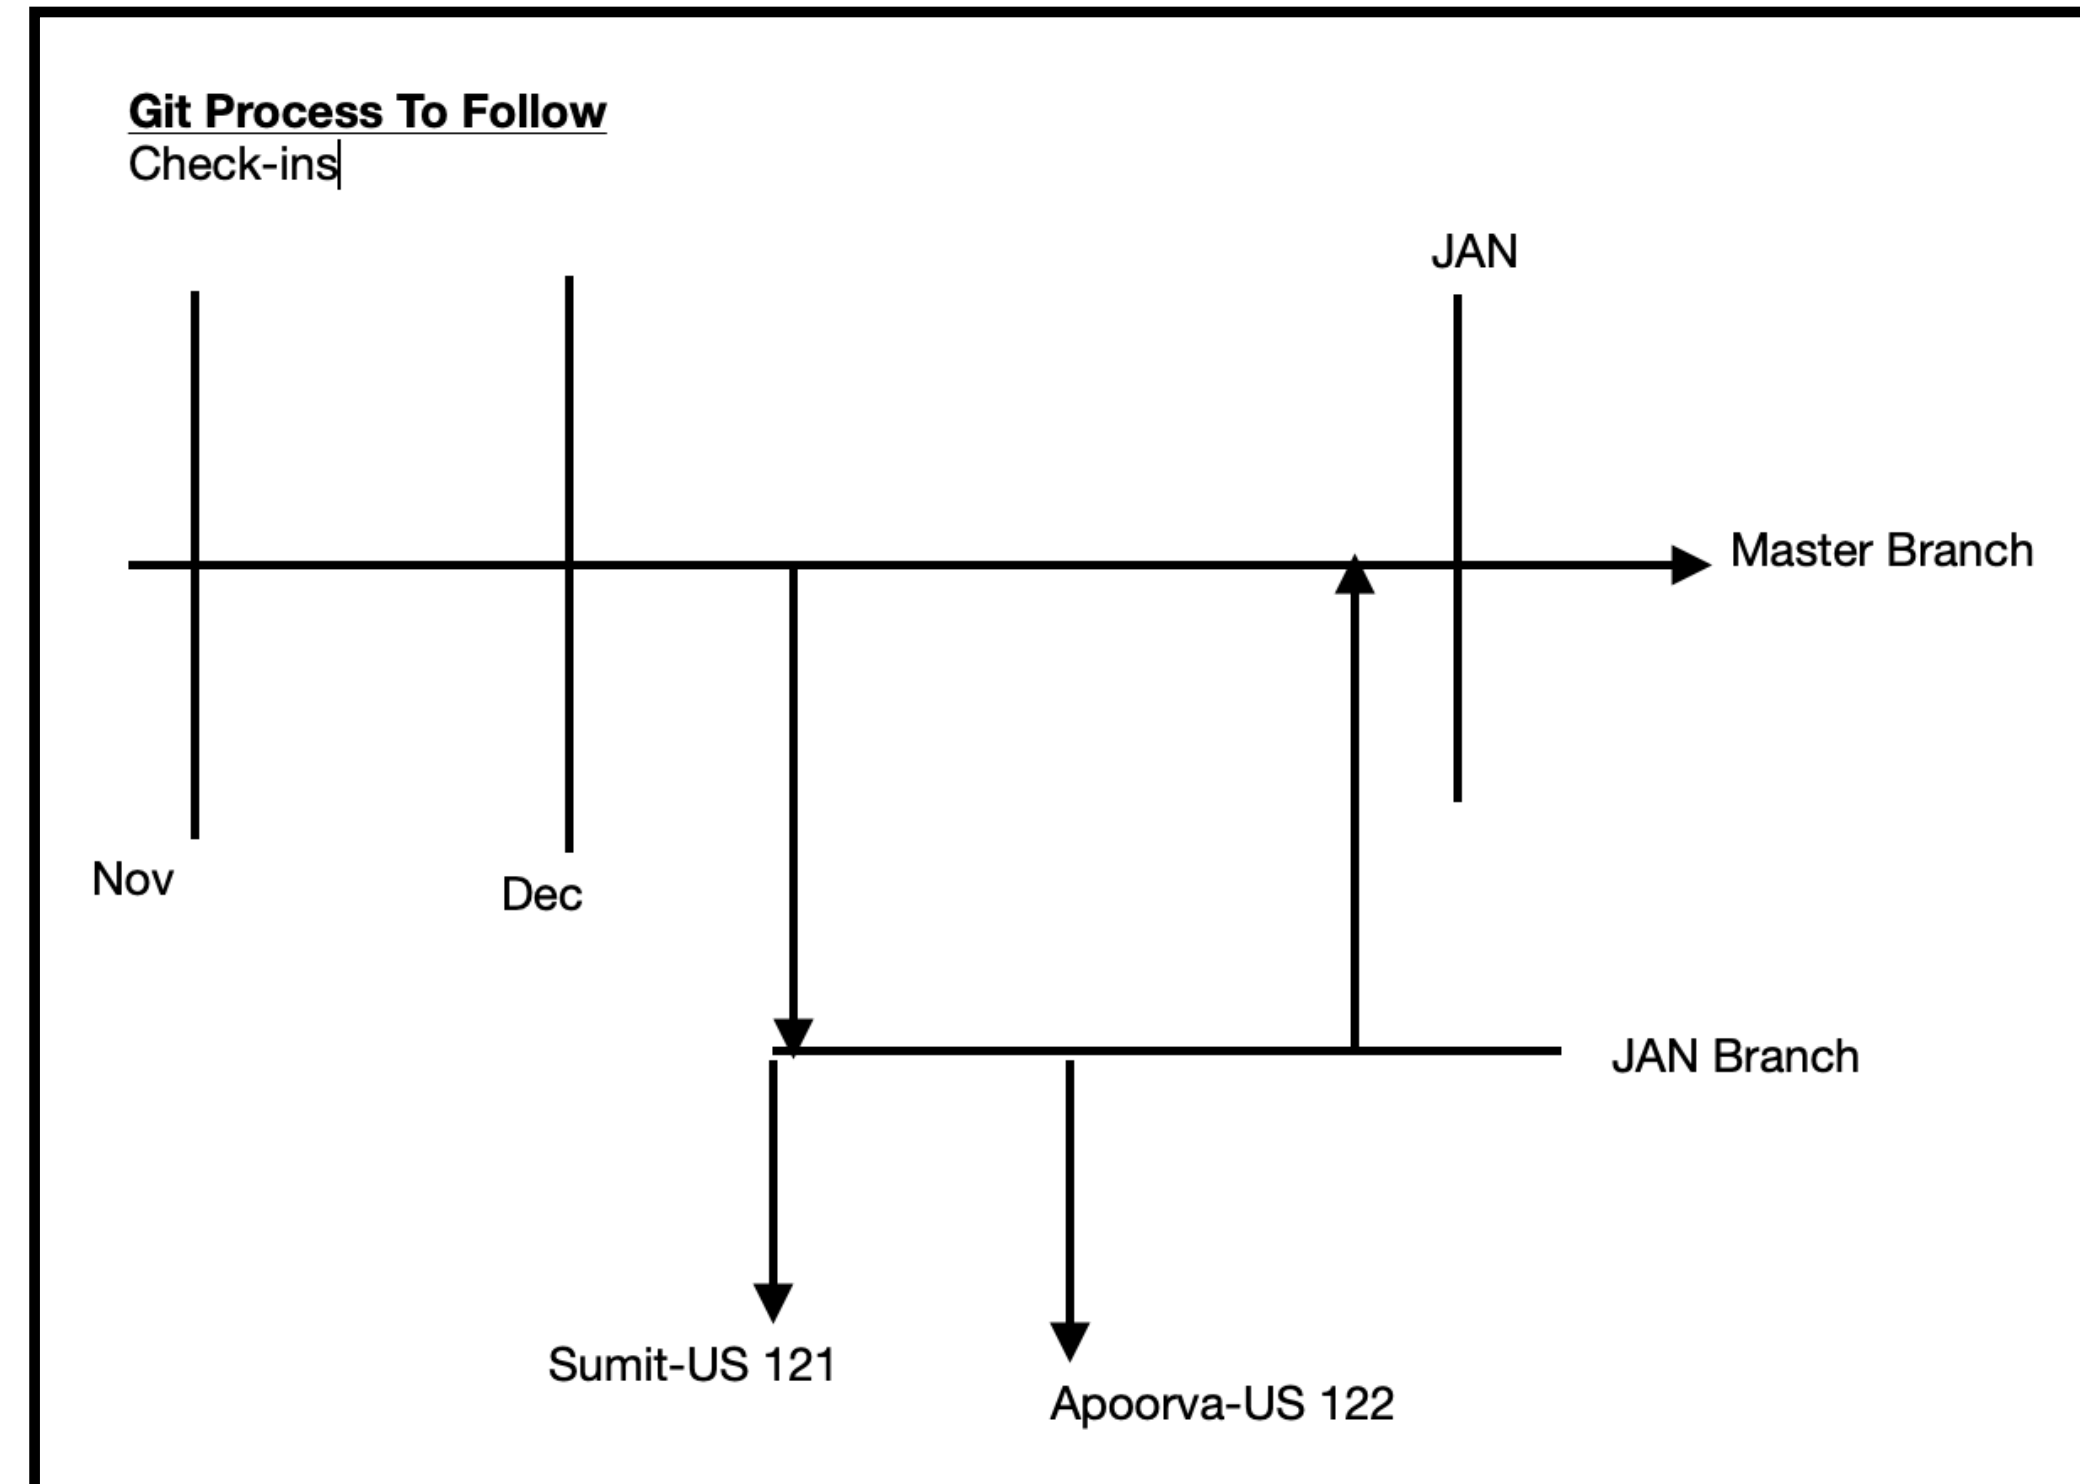

GITHUB

- ▶ CREATE GITHUB REPO
- ▶ CONNECT LOCAL REPO
- ▶ GIT PUSH
- ▶ GIT PULL
- ▶ EXISTING REPO

WORKING WITH TEAM

- ▶ Code Management
- ▶ Resolve Git Conflicts
- ▶ Git Rebase
- ▶ Pull Request

A black and white photograph of three wind turbines against a dramatic, cloudy sky. The turbines are white and have three blades each. The largest turbine is in the foreground on the left, and two smaller ones are in the background, creating a sense of depth.

GIT BASH

GIT BASH

- ▶ Setup Git Bash
- ▶ Git version
- ▶ Local Repository
 - ▶ Git init
 - ▶ Git status
 - ▶ Git add
 - ▶ Git commit -m "message"

Git --help

```
These are common Git commands used in various situations:

start a working area (see also: git help tutorial)
  clone      Clone a repository into a new directory
  init       Create an empty Git repository or reinitialize an existing one

work on the current change (see also: git help everyday)
  add        Add file contents to the index
  mv         Move or rename a file, a directory, or a symlink
  restore    Restore working tree files
  rm         Remove files from the working tree and from the index

examine the history and state (see also: git help revisions)
  bisect     Use binary search to find the commit that introduced a bug
  diff       Show changes between commits, commit and working tree, etc
  grep       Print lines matching a pattern
  log        Show commit logs
  show       Show various types of objects
  status     Show the working tree status

grow, mark and tweak your common history
  branch     List, create, or delete branches
  commit     Record changes to the repository
  merge      Join two or more development histories together
  rebase     Reapply commits on top of another base tip
  reset      Reset current HEAD to the specified state
  switch     Switch branches
  tag        Create, list, delete or verify a tag object signed with GPG

collaborate (see also: git help workflows)
  fetch      Download objects and refs from another repository
  pull       Fetch from and integrate with another repository or a local branch
  push       Update remote refs along with associated objects
```

WORKING WITH BRANCH

- ▶ Working with Branch
 - ▶ Git branch
 - ▶ Git Checkout
 - ▶ Git Fetch
 - ▶ Git log
- ▶ Merge Branch
 - ▶ Git merge

REMOTE REPOSITORY

- ▶ Git remote
- ▶ Git push
- ▶ Git pull
- ▶ Git clone
